

ROCKET(Mr.Cooper) Interview Experience

Name	Pandiyammal A
Role	Software Engineer Trainee
Offer	Intern + Full Time
Package	10 LPA
No of Rounds	5
Contact	6369381110

Round 1 – Short Programming

Platform: HackerEarth

Duration: 3 Hours

Question Pattern

- 27 MCQs
- 3 Coding Questions(Easy, Medium, Hard)
- 1 SQL Query

Topics

- Aptitude
- DSA
- DBMS
- Technical concepts

Around **40 students from the entire college** were shortlisted from this round.

Additional Round for Students Rejected in Round 1

This was an **extra round conducted for our batch**.

After Round 1, the company asked some students from the not shortlisted students to attend round 2 along with the students shortlisted from Round 1.

This round was conducted at the **college level for all departments**, but the selection method was different depending on the department.

In Our Department

The department faculty evaluated the students based on:

- ER Diagram for a given scenario
- Long coding based on the given use case

Around **60 students from the entire college** were selected through this process.

Round 2: Long Programming (100 students)

ER Diagram/ Class Diagram for the given use case (30 mins)

- Explain the diagram and answer their questions like why private variable, why you consider this as primary key , why you use multivalued attribute, like that

- System Architecture Design Diagram (15 mins) - Just a diagram to show the technologies that can be used to build the application.

Eg: React for frontend, MongoDB for database, Python Flask for backend.

- They will ask questions like why do you choose this tech? why unstructured DB over structured DB like SQL.
- Long coding: Code for any two classes in the given requirements (1 hr 45 mins)
Try to include some basic OOPS concepts but don't try to force fit.
- SQL Query from the same use case (1 Query)
Question:(eg) internship task completion tracking system

Tips:

If you draw ER diagram, first understand the use case and create the ER Diagram properly. Once the diagram is clear, writing the SQL query becomes much easier. It also helps you explain your SQL query to the panel because you can relate the query directly to your ER Diagram.

System Architecture Diagram - You don't need advanced knowledge. Just understand what it is, why it is used, and its basic use cases.

Coding

- Create separate classes properly.
- Apply basic OOP concepts wherever they naturally fit.
- Don't force OOP concepts unnecessarily.

For example, instead of writing everything inside one class, divide the responsibilities into separate classes so that the panel should be able to quickly understand **what you are trying to implement and why**.

SQL query - Don't just write the query.

Be ready to explain:

- What the query does
- Why you used a particular JOIN
- Why you used a particular condition
- How the tables are related
- What output the query produces

Your explanation should be clear and specific.

Round 3: Tech HR 1(30 mins)

More DSA and OOPS questions related to the use case.

OOPS :

Pillars of OOPS

Scenario based question(Bank Application)

In that bank application explain abstraction,inheritance,polymorphism and encapsulation

Abstraction VS interface difference

Diamond problem

Don't give only textbook definitions. Explain concepts using practical examples. This makes it clear to the interviewer that you actually understand the concept instead of simply memorizing the definition.

DSA:

Input and output given you have to tell various approaches .

Q1.find the nearest maximum number

input:6,8,0,1,3

Output:8,-1,1,3,-1

Q2.find missing elements from the given array

Input:6,4,1,2,0,3

Output:5

Q3.For the given graph you have to write inorder,preorder,postorder traversal

First explain the Brute Force approach. Even if you don't immediately know the optimal solution, explain your thought process clearly.

The interviewer wants to see how you approach and solve a problem.

Round 4: Technical HR 2 (1 hour)

For the given application ,you have to write Long Coding in paper (same qn as given in the round 2)

After you written you have to explain your code to panel member what you write,why you use this method, how you store the input,output like that

1 SQL query (focus on joins,subquery related queries , filters(where,having,group by,order by,etc..))

Round 5 – General HR(15 mins)

Duration: Around 10 Minutes

This round was completely based on:

- Your Resume
- Projects
- Academic experience
- College journey
- Soft skills
- Communication

Be prepared to explain **everything mentioned in your resume**.

Your communication and confidence will also be observed.

Overall Interview Experience

From my experience, Mr. Cooper mainly expects fundamentals and basic practical knowledge,

They don't expect you to have advanced or expert-level knowledge.

They mainly look for strong OOP fundamentals, Good DSA basics, DBMS knowledge, Basic SQL skills, Basic problem-solving ability, Ability to apply concepts practically, Clear communication.

If you have a good understanding of **OOP, DSA, and DBMS**, and you can clearly explain what you know, that is enough.

All the best! If you have any doubts about the recruitment process, feel free to ask.
